

Acknowledgments

Steven Hynes would like to acknowledge the help and ideas of Brian Skiff (Lowell Observatory). Other individuals whose contributions have eased the task include Owen Brazell, Murray Cragin, Steve Gottlieb, and Don Miles. Much of the research for the book was carried out at the library of the Nuffield Radio Astronomy Laboratories, Jodrell Bank, and he is indebted to the Director for permission to use these facilities and also to Sarah Jackson, the librarian, for her help and hospitality. Additional research was carried out at the library of Keele University and the Royal Astronomical Society where Peter Hingley, the RAS librarian, was very helpful.

Brent Archinal would like to thank several individuals who helped in the course of the cataloging work done for this book. Brian Skiff, in particular, has been of immense help. He has provided copies of both his list of open clusters with improved positions and other data, and of general information on Galactic globular clusters. Brian has continually provided updated information on star clusters gleaned from various publications and his own observations. He has also provided invaluable advice concerning various sources of data and answered many questions about star clusters in general. Murray Cragin, James Lucyk, the late Barry Rappaport and their publisher, Willmann-Bell, provided a machine-readable copy of their list of star clusters in the first edition of *The Deep Sky Field Guide to Uranometria 2000.0* (Willmann-Bell, Inc., 1993). S. George Djorgovski (Caltech) has provided machine readable copies of several data tables regarding Galactic globular clusters as originally published in Djorgovski and Meylan (eds.), *Structure and Dynamics of Globular Clusters*, *ASP Conf. Ser.* 50, 1993. William Harris (McMasters' University) and Hugh Harris (USNO Flagstaff) have also provided useful information concerning such clusters.

A number of individuals have graciously provided their own observations or other information on the identities of various star clusters and related objects. The accuracy of the cataloging work done here owes a great deal to these individuals—although what errors may remain are certainly our own. Besides Brian Skiff, in particular, Alister Ling, Harold Corwin, Jr. (NASA/JPL/IPAC), Hugh Harris (USNO, Flagstaff, AZ), Jenni Kay, Steve Gottlieb, Barbara Wilson, Yann Pothier, Al Lamperti, Randall Poole, Dave Riddle, Susan French, Steve Mencinsky, Doug Snyder,

Bruno S. Alessi, Joe Bergeron, Russell Lederman, Larry Sykara, Timo Karhula, Guy Mackie, Paul Markov, Glenn LeDrew, Mikkel Steine, Philipp Teutsch, Dana Patchick, and Robert Erdmann, Jr. have all provided such information. We also thank Gaspar Bakos for permission to reprint his superb drawing of M13, shown in Figure 8.4 on page 263.

Brenda Corbin and Greg Shelton, USNO librarians, have been of tremendous assistance in tracking down references for this work. Even the most obscure references were found quickly and efficiently, either at the USNO library or in a few unusual instances, via a loan from other libraries. Steve Dick, USNO Historian, has provided useful information and assisted in obtaining the image of the USNO 40-inch telescope shown in Figure 4.1 on page 46.

Jenny Prence and Donita Polly, USGS librarians in Flagstaff, AZ, have also assisted us in this work.

We would also like to express our gratitude to Tracy Knauss for her kind permission allowing us to reprint (in Chapter 7) the deep CCD images of faint Galactic globular clusters, taken by her and the late Mike Morton.

Keith Scollick of NASA/GSFC assisted with several questions in regard to the use of his marvelous SkyView utility. The SAOimage utility, written by Mike van Hilst and maintained by Doug Mink of the Smithsonian Astrophysical Observatory, has also proved very useful. Brian Cuthbertson and Emil Bonanno have provided copies of the *HyperSky* and *MegaStar* software, respectively, that have proven useful in helping to identify various star clusters.

As will be more fully explained later we have made extensive use of the Digital Sky Survey to confirm the existence of many clusters and to refine their positions which have been a longstanding problem.

The Space Telescope Science Institute has granted permission to reprint images from the Palomar Observatory Sky Survey, via the northern portion of the Digitized Sky Survey (DSS-N in this work). Lynn Kozloski provided assistance in obtaining this permission. Use of these images is courtesy of the Palomar Observatory and Digitized Sky Survey created by the Space Telescope Science Institute, operated by AURA, Inc. for NASA and is reproduced here with permission from AURA/STScI.

x Acknowledgments

The Royal Observatory Edinburgh (ROE), the UK Particle Physics and Astronomy Research Council, and the Anglo-Australian Observatory have granted permission to reproduce images from the UK Schmidt survey, the southern portion of the Digitized Sky. Jason Cowen of ROE Media Services and Susan Tritton of the ROE Plate Library provided assistance in obtaining this permission. Use of these images is courtesy of the UK Schmidt Telescope (copyright is owned by the Particle Physics and Astronomy Research Council of the UK and the Anglo-Australian Telescope Board) and the Digitized Sky Survey created by the Space Telescope Science Institute, operated AURA, Inc, for NASA, and is reproduced here with permission from the Royal Observatory Edinburgh.

Ann Cowley and David Hartwick, co-editors of *Publications of the Astronomical Society of the Pacific*, and the Astronomical Society of the Pacific provided permission to reprint the photographs of Robert Trumpler and Heber Curtis.

Alison Doane, Curator of Astronomical Photographs, Harvard College Observatory, assisted in obtaining permission to use the photograph of Harlow Shapley.

The cataloging research has made use of the SIMBAD database operated at CDS, Strasbourg, France. Particular thanks is given to Gerard Jasniewicz of the CDS for much useful advice on accessing SIMBAD. This research has made use of the NASA/IPAC Extragalactic Database (NED) which is operated by the Jet Propulsion Laboratory, Caltech, under contract with the National Aeronautics and Space Administration. Special acknowledgement is also made to Göstå Lyngå, whose 1987 *Lund Catalogue* proved very useful.

Finally, we deeply appreciate the generosity of Bruno Alessi, Harold G. Corwin, Jr., Murray Cragin, Sue French, Jeff Medkeff, Mati Morel, Stephen O'Meara, Brian Skiff, Harold Suiter, and Philipp Teutsch who took the time to read and extensively comment on a near-final version of this work. Their comments have resulted in greatly improving the book you are now holding. However, any problems that remain in this text are the authors' alone.

From Brent Archinal, to JoAnne

From Steven Hynes, to my wife Julie and my children Carina and Anya
